

## VPN

A virtual private network (VPN) is a private communications network often used within a company, or by several companies or organizations, to communicate confidentially over a publicly accessible network.

A VNP allows you to securely and reliably join several locations through a regular Internet connection. The communications are concealed on a virtual tunnel, where data travels encrypted thus assuring confidentiality.

At Web2Mil we can help you create and implement a VPN to joining all the nodes of your network using Open Source Software, giving you a low cost and high flexibility solution.

Contact us to know more about VNP's and how we can help you.
